Results Interpretation

Body Composition Analysis
Body weight is the sum of Body Fat Mass and Lean Body Mass, which is composed of Dry Lean Mass and Total Body Water.

Muscle-Fat Analysis
Compare the bar lengths of Skeletal Muscle Mass and Body Fat Mass. The longer the Skeletal Muscle Mass bar is compared to the Body Fat Mass bar, the stronger the body is.

Obesity Analysis
BMI is an index used to determine obesity by using height and weight. PBF is the percentage of body fat compared to body weight.

Segmental Lean Analysis
Evaluates whether the muscles are adequately developed in the body.
The top bar shows the comparison of muscle mass to ideal weight while the bottom bar shows that to the current weight.

Body Composition History
Track the history of the body compositional change. Take the InBody Test periodically to monitor your progress.

Body Fat-Lean Body Mass Control
Based on current body composition, the recommended change in Lean Body Mass and Body Fat Mass for a good balanced ratio. The '+' means to gain and the '-' means to lose.

Basal Metabolic Rate
Basal Metabolic Rate is the minimum number of calories needed to sustain life at a resting state. BMR is directly correlated to Lean Body Mass.
